2021 Drinking Water Quality Report of the City of Edgewater

We are pleased to report that our drinking water meets all federal and state requirements.

We're Very Pleased to Provide You With This Year's Drinking Water Quality Report.

This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

Where Does Our Water Come From?

Our water source is ground water from fourteen wells. The wells draw from the Floridan Aquifer. It is aerated to improve taste and odor, and chlorinated for disinfection purposes, ammoniated to control disinfection byproduct formation, softened to lower total hardness and alkalinity, pH adjusted and filtered for aesthetic purposes. It is then treated with a phosphate-based inhibitor to reduce corrosion of your household plumbing.

Regulatory Information

Lead in Drinking Water

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Edgewater is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Water Monitoring

The City of Edgewater routinely monitors for contaminants in your drinking water according to Federal and State laws, rules, and regulations. Except where indicated otherwise, this report is based on the results of our monitoring for the period of January 1 to December 31, 2021. Data obtained before January 1, 2021, and presented in this report is from the most recent testing done in accordance with the laws, rules, and regulations.

How YOU Can Help

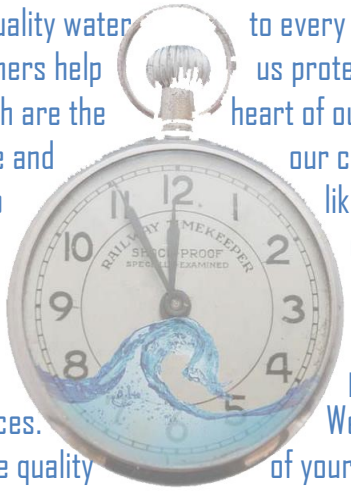
Please Do Not Flush Medications

"Please DO NOT FLUSH your unused/unwanted medications down toilets or sink drains. For more information, please click here at **http://www.dep.state.fl.us/waste/categories/medications/pages/disposal.htm**.

EPA REGULATIONS

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at **1-800-426-4791.**

We at the City of Edgewater work around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future. We would also like you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to insuring the quality of your water. If you have any questions or concerns about the information provided, please feel free to call any of the numbers listed in this report.



SPECIAL HEALTH INFORMATION

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

In 2021 the Department of Environmental Protection performed a

Source Water Assessment on our system.

The assessment was conducted to provide information about any potential sources of contamination in the vicinity of our wells. There are 4 potential sources of contamination identified for this system all with a low susceptibility score and concern level. The assessment results are available on the FDEP Source Water Assessment and Protection Program website at *https://fldep.dep.state.fl.us/swapp/*

If you have any questions about this report or concerning your water utility, please contact Bob Polizzi, Water Plant Manager, at (386) 424-2400 ext.4031 from 8:30 AM – 4:30 PM Monday through Friday. We encourage our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled Council meetings. They are typically held on the first and third Mondays of each month at 6:00 PM in the Council Chambers at 104 North Riverside Drive Edgewater, Florida 32132. Please check the City's website http://www.cityofedgewater.org/ for the most up-to-date schedule.

Water Conservation

Florida's groundwater resources are vulnerable to wasteful water-use activities. So that we have water for generations to come please consider your water consumption, and use only the water you need. For more information about water conservation check out the St. Johns River Water Management District website at https:// www.sjrwmd.com/water-conservation/ .

Did You Know?

- Less than 1% of the water supply on earth can be used as drinking water.
- About 6,800 gallons of water is required to grow a day's food for a family of four.
- A person can live about a month without food, but only about three days without water.
- An estimated 790 million people (11% of the world's population) live without access to an improved water supply.
- A small drip from a faucet can waste as much as 34 gallons of water a day.
- Drinking water is delivered via one million miles of pipes across the United States.
- Bottled water can be up to 2000 times more expensive than tap water.
- More than half of the water used in a home is used in the bathroom. A bathtub requires about 70 gallons of water, while taking a five minute shower uses 10-35 gallons of water. Don't use your toilet as a trashcan.
- The average American uses 100 gallons of water daily.
- More than 50% of residential water use occurs outdoors, mostly for landscape irrigation.
- Using reclaimed water is an alternate water supply to use for landscape irrigation, washing of your home, vehicle or boat.

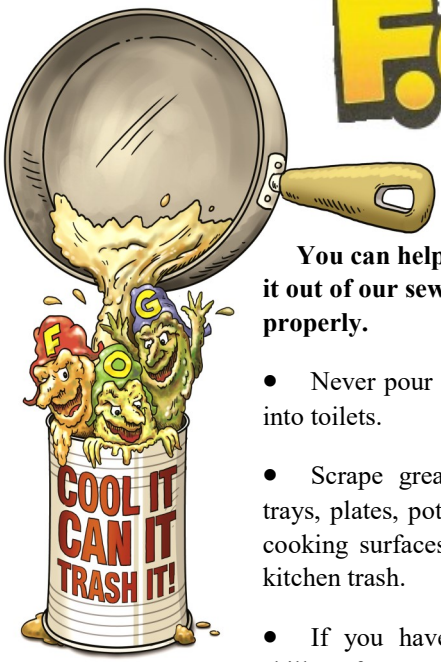
FIGHT F.O.G.



You can help us fight F.O.G. and keep it out of our sewer lines by disposing of it properly.

- Never pour grease down sink drains or into toilets.
- Scrape grease and food scraps from trays, plates, pots, pans, utensils, grills and cooking surfaces into a metal can or your kitchen trash.
- If you have grease left in a pot or skillet after cooking, let it cool and then pour into a metal can. When the can is full, simply throw it in your kitchen trash.
- Do not put grease down garbage disposals.

Is It Safe to Drink From Your Garden Hose?

The water in the garden hose is not generally safe for drinking. It contains bacteria which can cause an adverse effect on your health. Substances used in vinyl garden hoses to keep them flexible can get into the water as it passes through the hose. These chemicals leach into the water, especially when heated by the sun. These chemicals are not good for you nor are they good for your pets. Allow the water to run for a short time in order to flush the hose before drinking or filling your pets' drinking containers. There are hoses made with "foodgrade" plastic that will not contaminate the water. Check your local hardware store for this type of hose.

Reclaimed Water

Frequently Asked Questions:

How Does Reclaimed Water Differ from Drinking Water?

Reclaimed water is highly treated and disinfected but still contains some constituents at levels outside the desirable range for drinking water. Specifically, reclaimed water may have higher levels of salts, nutrients (nitrogen and phosphorus), and pathogens (e.g., bacteria and viruses). Reclaimed water has been safely used for non-drinking purposes in Florida for more than 40 years, but because of its composition, this water source should never be used for drinking or sanitary purposes.

Are There any Contaminants in Reclaimed Water?

Reclaimed water is known to contain small concentrations of inorganic and organic contaminants. There are NO documented cases of adverse health effects from contact with reclaimed water in Florida, but you should be aware that pathogens, nutrients, salts, metals, and emerging contaminants (for example, traces of pharmaceuticals) have been detected in reclaimed water.

Is Reclaimed Water Safe for Turf and Landscape Plants?

Reclaimed water can be safely used to irrigate turf and most other landscape plants. In fact, reclaimed water often contains nutrients (nitrogen and phosphorus) that can be considered part of the fertilizer needs of the landscape.

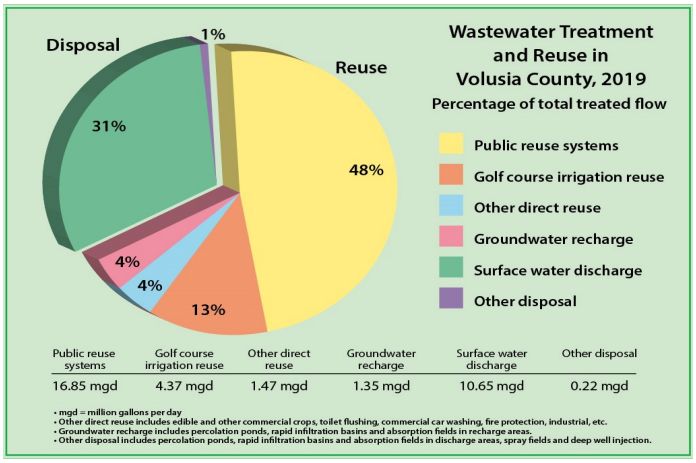
Can I Use Reclaimed Water on my Vegetable Garden?

The Florida Department of Environmental Protection states that reclaimed water should NOT be directly applied to the surfaces of vegetables or other edible crops that are not peeled, cooked, or thermally processed before being consumed. This statement essentially means that as long as you peel or cook your vegetables, they may be safely consumed after being grown with reclaimed irrigation water. The statement also means that indirect application methods, such as ridge or furrow irrigation, drip irrigation or a subsurface distribution system, which preclude direct contact, are allowed for edible crops that are not peeled, skinned, cooked, or thermally processed before consumption.

Can I Overuse Reclaimed Water?

Yes, Remember that overwatering is overwatering, regardless of the water source. If you use reclaimed water for lawn irrigation, overwatering will cause the same damage as overwatering with other water sources. Only irrigate when soil and turf conditions indicate that irrigation is necessary. As a rule of thumb, only 3/4th to 1 inch of water is needed each week for most Florida turfgrasses. Also, nutrient (nitrogen, phosphorus) pollution may occur if the user over-irrigates the lawn because both reclaimed water that runs off on the surface and the water and nutrients that move below the root zone are lost.

Information Source: UF|IFAS UNIVERSITY of FLORIDA



Water reclamation (also called wastewater reuse, water reuse or water recycling) is the **process of converting municipal wastewater (sewage) or industrial wastewater into water that can be reused for a variety of purposes.**

In 1995 Edgewater began the reclaimed water process. Reclaimed water is Edgewater's alternate water supply, which is the treatment of wastewater to meet Florida Department of Environmental Protection standards, removing harmful organisms and substances, such as bacteria, viruses and heavy metal, so that it may be reused. Edgewater is pleased that by using reclaimed water, residents are able to assist in the conservation of our traditional freshwater supply and provide an environmentally responsible alternative to disposal of wastewater effluent. The use of reclaimed water reduces the demand on water supplies used for drinking water, enhances landscapes through irrigation, reduces groundwater pumping, helps residents save money on their utility bill. Reclaimed water is a water source lower in salt content which will not harm plants, has a lower iron content which will not stain walkways and buildings. A couple more environmental benefits of using reclaimed water is that it recharges the shallow surficial aquifer and reduces the quantity of effluent discharged into the Indian River. Seventy plus percent of all wastewater in Edgewater is treated and utilized by residents as reclaimed water.

Definitions

In the tables on the following pages, you may find unfamiliar terms and abbreviations. To help you better understand these terms we've provided the following definitions:

Maximum Contaminant Level or MCL

The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal or MCLG
The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Action Level (AL)
The concentration of a contaminant which, if exceeded, triggers treatment or other require-ments that a water system must follow.

Maximum residual disinfectant level or MRDL
The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum residual disinfectant level goal or MRDLG
The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfect ants to control microbial contaminants.

Parts per billion (ppb) or Micrograms per liter (µg/l)
one part by weight of analyte to 1 billion parts by weight of the water sample.

Parts per million (ppm) or Milligrams per liter (mg/l)
one part by weight of analyte to 1 million parts by weight of the water sample.

"ND" means not detected and indicates t hat the substance was not found by laboratory analysis.

"N/A" means not applicable.

Notes on Contaminants

To ensure that tap water is safe to drink, the EPA prescribes regulations, which limit that amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

(A) **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

(B) **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

(C) **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

(D) **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

(E) **Radioactive contaminants**, which can be naturally occurring or be the result of oil and gas production and mining activities.

Water Analysis Table

Contaminant and Unit of Measurement	Dates of sampling (mo./yr.)	MCL Violation Y/N	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination
Inorganic Contaminants							
Fluoride (ppm)	05/20	N	.16	N/A	4	4	Erosion of natural deposits; discharge from fertilizer and aluminum factories. Water additive which promotes strong teeth when at optimum level is 0.7 ppm
Sodium (ppm)	05/20	N	46	N/A	N/A	160	Salt water intrusion, leaching from soil
Barium (ppm)	05/20	N	.0035	N/A	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits

Contaminant and Unit of Measurement	Dates of sampling (mo/yr)	MCL Violation (Y/N)	Level Detected	Range of Results	MCLG	MCL	Likely Source of Contamination
Stage 2 Disinfectants and Disinfection By-Products							
Chloramines (ppm)	1/21-12/21	N	3.1	.8-4.8	MRDLG = 4	MRDL = 4.0	Water additive used to control microbes
Haloacetic Acids (HAA5) (ppb)	07/21	N	16.5	10.7 & 16.5	N/A	60	By-product of drinking water disinfection
Total Trihalomethanes (TTHM) (ppb)	07/21	N	9.0	8.4 & 9.0	N/A	80	By-product of drinking water disinfection

Contaminant and Unit of Measurement	Dates of sampling (mo./yr.)	AL Exceeded Y/N	90th Percentile Result	No. of sampling sites exceeding the AL	MCLG	AL (Action Level)	Likely Source of Contamination
Lead and Copper (Tap Water)							
Copper (tap water) (ppm)	06/20	N	0.416	0	1.3	1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
Lead (tap water) (ppb)	06/20	N	5.0	1	0	15	Corrosion of household plumbing systems, erosion of natural deposits
